This course will give students experience in applying theory to real world applications such as internet and wireless communication problems. Then join us in supporting student growth in modeling with differential equations. Well-known examples include the Jones and Alexander polynomials.

Ljubic;J. This course discusses the concepts and theories associated with survival data and censoring, comparing survival distributions, proportional hazards regression, nonparametric tests, competing risk models, and frailty models. Topics will vary from year to year in areas of mathematics and their development.

Ordinary differentialequations: exact, separable, and linear; constant cryptanalysis. Lagrange inversion, exponential structures, combinatorial species.
